#### RATE THIS CHALLENGE

Some C++ data types, their format specifiers, and their most common bit widths are as follows:

- Int ("%d"): 32 Bit integer
- Long ("%ld"): 64 bit integer
- Char ("%c"): Character type
- Float ("%f"): 32 bit real value
- Double ("%lf"): 64 bit real value

#### Reading

To read a data type, use the following syntax:

```
scanf("`format_specifier`", &val)
```

For example, to read a character followed by a double:

```
char ch;  
double d;  
scanf("%c %lf", &ch, &d);
```

For the moment, we can ignore the spacing between format specifiers.

#### Printing

To print a data type, use the following syntax:

```
printf("`format_specifier`", val)
```

For example, to print a character followed by a double:

```
char ch = 'd';  
double d = 234.432;  
printf("%c %lf", ch, d);
```

**Note:** You can also use cin and cout instead of scanf and printf; however, if you are taking a million numbers as input and printing a million lines, it is faster to use scanf and printf.

#### Input Format

Input consists of the following space-separated values: int, long, char, float, and double, respectively.

#### Output Format

Print each element on a new line in the same order it was received as input. Note that the floating point value should be correct up to

3 decimal places and the double to 9 decimal places.

### Sample Input

```
3 12345678912345 a 334.23 14049.30493
```

### Sample Output

```
3
12345678912345
a
334.230
14049.304930000
```

### Explanation

Print int **3**,  
followed by long **12345678912345**,  
followed by char **a**,  
followed by float **334.23**,  
followed by double **14049.30493**.

C++

```
1  #include <iostream>
2  #include <cstdio>
3  using namespace std;
4
5  int main() {
6      // Complete the code.
7      return 0;
8  }
9
10
```
